#### Abstract

In 2007, the Philippine government passed the Anti-Rabies Act to address rabies in the country. However, rabies is still a major public health concern in many provinces. This study aimed to evaluate the knowledge, attitude, and practices (KAP) of residents on rabies, the Anti-Rabies Act, and responsible pet ownership (RPO) in Pampanga, Philippines. A cross-sectional survey was done from October 2017 to February 2018 in 92 randomly selected barangays in the province. Questionnaires were adapted from the similar studies. Logistic regression was used to identify factors associated with KAP. Results showed that most people have good knowledge of the Anti-Rabies Act, RPO, and moderate knowledge of rabies. Their attitude toward rabies was appropriate, and on RPO, moderate. The RPO practices by most dog owners were good and moderate for most cat owners. Moreover, the subjects' area of residence was a significant factor in their knowledge of RPO, and pet ownership status was a significant factor in their RPO attitude. In general, respondents showed satisfactory knowledge; however, there is a need to intensify information and education campaigns in rural areas.

Keywords: attitude, knowledge, Philippines, practices, rabies

## Introduction

Rabies is a disregarded zoonotic disease brought about by the Rabies virus (RABV). Rabies is fatal if left untreated but eminently preventable via an effective vaccine. ${ }^{1}$ All mammalian vertebrates are susceptible to the virus, but unvaccinated domesticated canines are the most significant human source rabies cases. Current statistics show that there are 59,000 human deaths per year due to canine rabies. By far, over $99 \%$ of all reported RABV infected-human cases were caused by exposure to unvaccinated domesticated canines. Most were reported in Africa and Asia. ${ }^{1}$ Monitoring of human and animal rabies cases are insufficient to almost non-existent in certain areas of the world where rabies is most prevalent. ${ }^{2,3}$ Mostly, in rabies-endemic countries, official reports and exposure remain substandard. The lack of reliable surveillance data for nations where the disease more prevalent is a significant hindrance in evaluating rabies' spread and prevalence. It is acknowledged that the actual number of rabies cases is underestimated due to unreported cases. 2,3

In the Philippines, the Department of Health reports about 200-300 deaths each year due to rabies, but the

[^0]actual number is likely higher. ${ }^{4}$ The Philippine Government has taken legislative actions to address the issue by the Anti-Rabies Act of 2007, which encouraged mass vaccination, a centralized database system, animal impounding and control, an education campaign, administration of pre-exposure prophylaxis and postexposure treatment to animal bite victims, and a call for pet owners to be more responsible. With this legislation, the goal of a "Rabies-Free Philippines by 2022" is more attainable, but the program still faces certain stumbling blocks like program funding, lack of local government support, lack of awareness in prevention and control, and the lack of support from other sectors of government and industry. ${ }^{5}$

This study's objectives were to describe the knowledge, attitude, and practices (KAP) on rabies, the Anti-Rabies Act, and responsible pet ownership (RPO), and identify factors associated with it.

## Method

The survey was conducted in the province of Pampanga, located on the island of Luzon, Philippines. The province is divided into an independent city, two

[^1]component cities, and 19 municipalities, with 12 district hospitals and one regional hospital. In 2017, Pampanga was one of the top ten provinces with a high incidence of animal rabies in the Philippines.

With a population of 2.6 million in 2015, a minimum sample size of 451 Pampanga residents was calculated using the sample size computation for estimating proportion with $95 \%$ confidence level, $5 \%$ margin of error, $50 \%$ response distribution, and 1.17 design effect. Multi-stage sampling was utilized. A total of 538 barangays (the smallest administrative division in the Philippines, known as the basic community/unit in municipalities) were divided into strata according to the occurrence of animal rabies cases in the area; 125 with cases and 413 with no cases. The target number was set to 460 , consisting of 92 barangays with five respondents each. Random selection from the alphabetical list was made using a random number generator, yielding 21 barangays with rabies cases and 71 barangays without rabies. Then, five households were selected per barangay. The first household was selected randomly; then the next four closest households were included in the study. Within each household, one adult (18 years old and over) was interviewed.

A questionnaire-based on similar studies was adapted and contextualized to the local setting. ${ }^{6-11}$ Knowledge was assessed through true-or-false questions, a Likert scale of 1-4 was used for the attitude, and yes-or-no questions were utilized for the practice. Demographic information was also obtained. The interviews were conducted from October 2017 to February 2018 in Kapampangan, the most common language spoken in Pampanga.

Data encoding, management, and analysis were done using MS Excel and Stata 13 (serial no. 301306217523 ). Descriptive statistics were calculated for the demographics and variables of interest. Stratified analysis was used to compare responses between locations. The KAP scores were also categorized according to Bloom's cut off point (less than $60 \%$ is low, $60 \%-80 \%$ is moderate, and more than $80 \%$ is high). ${ }^{7}$ Logistic regression analysis was used to identify the KAP (categorized based on median (Md): $0=$ score Md and $1=$ score $>\mathrm{Md}$ ). Initially, each demographic variable's crude association to the dependent variable, KAP, was determined using simple logistic regression; all variables with p-value 0.25 were included in the full model using multiple logistic regression, then the final model was selected using backward elimination. A p-value of $<0.05$ was considered significant.

## Results

A total of 453 participants were included in the study. Table 1 shows the demographic characteristics of the
respondents. More than half of the respondents were aged 42 years and over. Most ( $58.5 \%$ ) of the respondents owned two or more dogs and around $35 \%$ owned one dog. Almost half of the respondents are cat owners: $28.5 \%$ owned one while $17.3 \%$ had two or more.

Table 2 presents a descriptive analysis of the respondents' knowledge of rabies, the Anti-Rabies Act, and RPO. Almost all ( $93.2 \%$ ) of the respondents had heard of rabies. The majority $(81.2 \%)$ believed that a virus causes rabies; it can be transmitted from cats ( $97.4 \%$ ), bats ( $53.6 \%$ ), and snakes ( $53.2 \%$ ); and can be transmitted through bites, licks, or scratches from rabid animals ( $93.4 \%$ ). On the other hand, most did not believe that rabies can be transmitted through inhalation ( $69.1 \%$ ), or bites from mosquitos and other insects ( $62.0 \%$ ). Most of them believed that a rabid animal displays excess salivation ( $87.9 \%$ ); is not quiet and inactive ( $73.1 \%$ ); that leashing or caging of pets ( $82.6 \%$ ) and vaccination ( $94.5 \%$ ) can help in controlling rabies, and that immediate and thorough washing of bite wounds is necessary ( $93.2 \%$ ). Most ( $79.5 \%$ ) also believed that seeking help from a faith healer after a biting incident is inappropriate. However, more than half ( $53.6 \%$ ) did not believe that rabies has no cure. A similar pattern was observed in the responses when the location is considered, except for the belief that rabies has no cure, where $51.2 \%$ in the rural area believed it is incurable.

On the Anti-Rabies Act, $90.7 \%$ of the participants were aware that dog registration is required and those dog owners who fail to vaccinate their pets are penalized ( $72.2 \%$ ). For most of the provisions of the Act, the respondents were well aware of the given information. However, only $41.9 \%$ of the participants were aware that there is a law about rabies control. A similar pattern was also observed when stratified by location.

On RPO, most understood that proper care of pets helps to prevent the spread of rabies ( $92.1 \%$ ); that they should restrain their pets from wandering ( $75.3 \%$ ), and not allow them to defecate anywhere without cleaning up ( $87.9 \%$ ); and give food to pets on a regular basis ( $95.4 \%$ ). About $75.7 \%$ were aware that a pet owner should have an immunization record of the pet, and 79\% were aware that a sick pet should be taken to a veterinarian. They also believed that animal bites' incidences should be reported to the proper authorities ( $84.6 \%$ ), and the pet owner should agree to keep the pet leashed if it bites someone ( $91.4 \%$ ). However, they disagreed that a pet involved in a bite incident should be destroyed ( $58.1 \%$ ). Almost the same percentages were observed in the stratified analysis.

None of the demographic variables were associated with knowledge on rabies or Anti-Rabies Act from the logistic regression analysis. On factors associated with
the RPO, results showed that the area of residence is a significant influence. Having above-median knowledge on RPO is twice as likely in respondents living in urban barangays ( $\mathrm{OR}=1.990$, $95 \% \mathrm{CI}: 1.299,3.049$ ) compared to those in rural barangays.

In terms of attitudes toward rabies, almost all of the respondents claimed that they would report and seek medical help if they are bitten ( $92.8 \%$ ), scratched $(85.0 \%)$ by a stray dog or cat, and bitten by their pet ( $89.7 \%$ ). In addition, the community showed a positive attitude towards the rabies control campaign. These patterns were consistent in urban and rural areas and areas with and without rabies' presence.

Regarding RPO's attitudes, the community, in general, strongly agreed that leashing or caging of their pets is their responsibility ( $66.9 \%$ ). Amongst all, $63.1 \%$ strongly agreed that they were responsible for the cost of vaccinating their pets. Additionally, 59.8\% said they were willing to have their pets spayed or neutered, with $61 \%$ claiming that allowing their pets to become pregnant or impregnate another animal must not be permitted. Amongst all, $63.2 \%$ believed that it is not a cruel thing to leash or cage a pet. A similar pattern of responses was observed per area of residence and per area of presence of a rabies case. Table 3 shows the summary distribution of the responses on attitude toward rabies and RPO.

Moreover, logistic regression showed that none of the demographics were significantly associated with attitude toward rabies ( p -value $>0.05$ ). On the other hand, pet ownership status was a significant factor in RPO attitude. Respondents with dogs were 1.53 times more likely to have an above-median attitude compared to those without pets.

On practices on RPO, Table 4 presents the summary. Most pet owners ensured that their pets $(80.2 \%$ and $64.9 \%$ for dogs, and cats, respectively) are vaccinated, but only some ( $37.9 \%$ ) had records of their immunization on hand. Almost $60 \%$ of the pet dogs were always leashed, $65.2 \%$ were leashed when outside the house, and $45.2 \%$ were always caged. On the other hand, only a small percentage of cat owners kept their pet leashed $(24.5 \%)$ or caged $(27.9 \%)$. Most of the dogs ( $68.5 \%$ ) were not allowed to wander free, while most cats ( $47.6 \%$ ) were. Almost all dog owners ( $92 \%$ ) fed their dogs every day, while only $85.1 \%$ of the cat owners fed their cats every day. Only $54 \%$ take their pets to the veterinarian when they are ill.

Age and area of residence are significant factors in terms of dog owners' RPO. Dog owners aged 30-41 years are 2.15 times and $>42$ years are 1.43 times more likely to have an above-median practice than those $<29$ years. Those in urban barangays are 2.17 times more likely to have an above-median practice than those in

moderate level of knowledge on rabies (79.9\%) and attitude toward RPO (60.9\%) was noted. Most of the cat owners also had moderate scores on RPO practice ( $52.4 \%$ ). Table 5 presents a summary of the KAP scores
categorized using Bloom's cut off point.
A significant association was found between the presence of rabies cases and the level of knowledge on RPO ( p -value $=0.001$ ), rabies $(\mathrm{p}$-value $=0.014)$, and

## Discussion

Rabies, due to its acute fatality, is an important concern in public health, especially in the Philippines. The World Health Organization (WHO) declares that the Philippines is one of the top ten countries battling the disease. The Department of Health ( DOH ) in the Philippines established a Rabies Prevention and Control Program that aims to achieve a "rabies-free" country by the year of 2022. In line with this national vision, this study explored the current KAP of pet owners from the province of Pampanga, Philippines.

Results showed that the respondents had a good working knowledge of rabies. Pet owners are aware that they should immediately report bite incidents, especially from pets suspected of rabies. However, only $42.9 \%$ of the participants were aware that there is an existing law on rabies control in the country. The study in Tanzania stated that people who had experienced suspected rabid bites within their households exhibited higher knowledge of rabies. ${ }^{12}$ Knowledge of rabies is also said to be high among respondents who had attained higher education (e.g., secondary education and above). ${ }^{8,12-14}$ This finding is consistent with this study as the respondents, whose highest educational attainment was mostly high school and above, exhibited moderate to good knowledge of ra-

Notes: ${ }^{1}$ respondents with dogs; ${ }^{2}$ respondents with cats; RPO: Responsible Pet Ownership
bies.
Overall, a positive attitude toward the rabies control campaign was also observed. There are also around $89 \%$ who are willing to pay for the vaccination of their pets. However, only a few of the respondents have records of their pets' immunization. A study by Beyene, et al., ${ }^{15}$ revealed that willingness to pay is significantly influenced by the pet owner's knowledge on rabies, transportation of pets, and distance of the owner's residence from the vaccination center. It is also said that immunization against rabies may be affected by the misunderstanding that the rabies vaccine is included in routine pet immunizations. ${ }^{16}$ Study showed that dog owners in the community were found to practise RPO more frequently, and those cat owners were observed to be less accustomed to leashing or caging their pets.

## Conclusion

In general, most of the respondents demonstrated a satisfactory knowledge of rabies, the Anti-Rabies Act, and RPO. In terms of the Anti-Rabies Act, it was notable that respondents were aware of key provisions of the law relating to actual practices such as vaccination, leashing, and meat trade. However, less than half of the respon-
dents were aware of the existence of the law. This indicates the need to strengthen the advocacy and education of the residents on the Anti-Rabies Act. In RPO's case, the history of a rabies case in the community was associated with the knowledge of responsibility of reporting bite incidence in the area. Furthermore, respondents from urban areas had better knowledge of RPO, indicating the need further to intensify information and education campaigns in rural areas.

## Ethics Approval and Consent to Participate

An ethics clearance was obtained from the Pampanga State Agricultural University Ethics Review Committee with ethical approval no. 0010605 issued last July 5, 2018, before the conduct of the study. Participants were provided an informed consent form to sign containing details on the study's purpose and objectives, the nature of involvement of the participants, and possible direct and indirect benefits. Voluntariness, confidentiality, and data management were also stated in the consent form.

## Competing Interest

Author declares that there are no significant competing financial, professional, or personal interests that might have affected the performance or presentation of the work described in this manuscript.

## Availability of Data and Materials

The data and materials to support the study's findings are available upon request to the corresponding author. The data are not available to the public due to the participants' privacy and confidentiality in the study.

## Authors' Contribution

Reynaldo Jr. DL. Bundalian conceptualized and designed the study, prepared, edited, and reviewed the manuscript. Monalisa B Lacson, Catherine S Bacani, Remedios D San Jose, Maria Fe S Bulao, and Neil C Tanquilut reviewed literature and collected data. Dinah R O Soriano, Agnes P Garing, and Artemio Jr. B Aquino performed data collection. Archie R Policarpio and Joey K T Mallari did data analysis and interpretation. Patricia J P Magsino designed the methodology, analyzed the data, and edited the manuscript. All authors discussed the study and contributed to the manuscript preparation and review.

## Acknowledgment

The authors would like to express their gratitude to the Commission on Higher Education K-12 Program for funding this research under the DARETO (Discovery- Applied Research and Extension Trans/Interdisciplinary Opportunities).
