Abstract
The COVID-19 pandemic has influenced the community's lifestyle, including adolescents' behavior. One aspect majorly affected was physical growth, which encompasses several areas, including nutritional status and personal hygiene. Maintaining the quality of physical growth is very important, even beyond the pandemic. Therefore, this study aimed to determine the influence of the COVID-19 pandemic on adolescents' nutritional status and personal hygiene. A literature review method was used through a bibliometric and content analysis of publications obtained from databases such as Google Scholar. The articles obtained were classified by publication year, study location, keywords, and journal titles. Based on the literature search, 11 articles were found on the influence of the COVID-19 pandemic on the nutritional status of adolescents, and 10 articles discussed the effect on personal hygiene. After reviewing the articles, it was concluded that the pandemic influenced adolescents' nutritional status and personal hygiene.

Keywords: adolescents, COVID-19, nutritional status, personal hygiene

Introduction
Coronavirus disease 2019 (COVID-19) is caused by an infection of the virus named SARS-CoV-2. The etiology or main cause is the transmission from one individual to another. This disease occurs through respiratory droplets produced when a carrier coughs, sneezes, or talks. This virus belongs to the family of coronavirus, which induces Severe Acute Respiratory Syndrome (SARS) and Middle East Respiratory Syndrome (MERS).1,2

The first case of COVID-19 was found in Wuhan, China, towards the end of 2019. Based on data from the World Health Organization until 30 September 2020, the cases worldwide reached 44 million, with 1,174,624 deaths.4 The Indonesian Ministry of Health data reported that 1 in 8 cases was found among children.5 Furthermore, the pandemic significantly affected adolescents' physical growth,5 encompassing several aspects, including nutrition and personal hygiene.6 Many adolescents suffered a decrease in immunity caused by food insecurity.7 The nutrition aspect relates to their daily food intake, while personal hygiene is concerned with maintaining cleanliness. When both aspects are well maintained, the physical growth of adolescents can proceed optimally.6,7

The continuity of physical growth among adolescents needs to be ensured,8-10 given that the pandemic has impacted their behavior.11-13 Therefore, studies are needed to examine the influence of COVID-19 on adolescents' physical growth. The results will help stakeholders identify the necessary steps to overcome the problem. These studies can be a reference or academic resource for future health emergencies, including pandemics.

The physical and personal hygiene of adolescents plays a critical role in their growth and development. Both characteristics are also associated with the welfare and health of the next generations.8 Studies are needed to provide references for public health and government readers to produce health policies in the post-pandemic. Therefore, this study aimed to examine the influence of the COVID-19 pandemic on adolescents' nutritional status and personal hygiene.

Method
This study used a literature review method with several scientific literature published between 2020 and 2022 collected from sources such as Google Scholar, PubMed, and Elsevier. A bibliometric and content analysis of publications obtained was conducted and classified based on the publication year, study location, keywords,
and titles. The keywords used were “the effect of the COVID-19 pandemic on adolescents’ nutritional status” and the "effect of the pandemic on adolescents' personal hygiene." The inclusion criteria were articles published in English, in international journals, and focused on the impact of the COVID-19 pandemic.

Results
A bibliometric and content analysis of publications obtained was conducted, and the articles were classified based on the year, location, keywords, and titles. Based on the literature search, 11 and 10 articles that discussed the influence of the pandemic on the nutritional status and personal hygiene of adolescents were found. The summary of these articles is shown in Tables 1 and 2.

Discussion
The Influence of the COVID-19 Pandemic on the Nutritional Status of Adolescents
The COVID-19 pandemic has culminated in significant malnutrition among adolescents. Based on the literature review, 3 papers focused on undernutrition or malnutrition, 7 on overweight, 9 on food insecurity, and 10 on unhealthy food (high-sugar diets, etc). The results showed that the burden of COVID-19 had led to an increase in the number of adolescents suffering from undernutrition and overweight. The government and policymakers have addressed this problem, including providing supplementary food to improve nutrition. Adolescents often consume high-fat and sugar foods, which are unhealthy for their bodies. This condition is influenced by their increased screen time, resulting in less attention to adequate food (preferring fast food) as well as the lack of parental knowledge about healthy food.

During the pandemic, the food supply for the community was significantly disrupted, and the stakeholders’ priority was largely focused on treating COVID-19 rather than providing nutrition education. Various policies implemented by the government include school closures to prevent the spread of this virus infection. Adolescents often consume fast and nutritionally poor foods, culminating in an increase in obese patients. The lack of specific nutritional guidelines also contributed to this issue. Due the government-imposed isolation, adolescents engaged in unhealthy behavior, such as consuming high-sugar foods frequently.

The stamina and nutritional status of adolescents need to be maintained optimally. Good nutrition will strengthen the body’s defense system against various diseases, including COVID-19. To prevent nutritional problems during the pandemic, there is a need to reduce adolescents’ addiction to fast food and maintain their physical activity according to health standards.

The Influence of the COVID-19 Pandemic on the Personal Hygiene of Adolescents
According to the literature review, 7 papers discussed the impact of the COVID-19 pandemic on personal hy-

The COVID-19 pandemic has significantly impacted the physical growth of adolescents, as evidenced by their nutritional status and personal hygiene. Therefore, stakeholders, including the government, were recommended to employ this study as a reference or academic resource in future health emergencies. The results can be used in the rehabilitation policy for physical growth in the post-COVID-19 pandemic.

**Conclusion**

The COVID-19 pandemic has significantly impacted the physical growth of adolescents, as evidenced by their nutritional status and personal hygiene. Therefore, stakeholders, including the government, were recommended to employ this study as a reference or academic resource in future health emergencies. The results can be used in the rehabilitation policy for physical growth in the post-COVID-19 pandemic.

Ethics Approval and Consent to Participate
The ethics approval and consent of this study were issued by the Ethical Research Committee of Politeknik Baubau, Number: 108/PLB/D.A7/PE/V/2023.

Competing Interest
The authors declare that there are no significant competing financial, professional, or personal interests that might have affected the performance or presentation of the work described in this manuscript.

Availability of Data and Materials
Data were collected from Google Scholar, PubMed, and Elsevier, published between 2020 and 2022.

Authors’ Contribution
RH conceptualized the review, interpreted the data, and became a corresponding author. AA, WONJS, and SP helped to collect literature and arrange the framework. WOSJ and SMS helped in designing and preparing the manuscript draft.

Acknowledgment
The authors are grateful to the Director of Politeknik Baubau, who has supported this study financially up to its publication. The authors are also grateful to all parties who have contributed to the completion of this study.
